

Robotic Process Automation

End-to-End business process management

Discover Process Gaps

- Understand current processes and (ERP) systems- IOT/data capture points
- Business rules farming
- Identify where change is needed
- Intuitive process visualization
- Drill-downs to variants and deviations or individual process instances

Perform Process Monitoring and Analytics

- Respond quickly to process events, business disruptions and technical disruptions
- Increase accuracy and effectiveness
- Leverage AI capabilities to adapt to interface changes or system updates
- Natural Interactions without the need for predefined inputs and outputs or codes

Design and Orchestrate Process

- Design, orchestrate and automate structured processes with workflow automation and decision(rules) automation
- Process driven integration - reducing manual intervention and enabling human centered interactions

Automate Process

- Automate high volume repetitive tasks with robotic process automation
- Enable differentiating end-to-end processes that span across different applications and systems
